AlphaVAT Version 4.5.5 Release Notes

This release contains essential fixes for high priority bugs and includes a new feature to allow users to save the calculation template from the 'Entity details' tab. Please see below for further details on the key changes:

Enhancements

The following enhancements have been included within this release:

Entity details - Save template

The 'Entity details' tab has been enhanced to allow users to save the calculation template without going into the VAT reports. In addition, the 'Template' row now makes users aware when they have unsaved changes to their calculation template.

These usability enhancements should ensure that users save their template where necessary so that subsequent periods are calculated as expected.

Preview & analysis - Save template

Previously, the 'Preview and analysis' tab contained a 'Ready to submit' button which acted as a prompt to save the calculation template and redirected to the 'Entity details' tab. To be consistent and more descriptive, this button has been renamed to 'Continue to Entity details'. In addition, we have added a specific 'Save template' button which is only available whereby the user has unsaved changes.

These usability enhancements should ensure that users save their template where necessary so that subsequent periods are calculated as expected.

Bug Fixes

The following bugs have been addressed by this release:

PESM builder - Duplicate steps

In specific scenarios, the allocation steps within the 'PESM builder' were being erroneously duplicated.

Data cleansing - Unable to delete custom check

In exceptionally large data cleansing scenarios, users were unable to remove established custom data checks.

Bug Fixes (cont'd)

File upload - Duplicate tag

In specific scenarios, calculation tags were becoming duplicated. Note that either version of the duplicate tag functioned as expected and so, did not cause calculation differences.

Calculation template - Unsaved changes

Previously, uploading allocation steps within the 'PESM builder' was incorrectly flagged as a change to the calculation template and so prompted the user to save.

Foreign exchange - Duplicate derived column

In specific scenarios, the derived GBP column was being erroneously duplicated which prevented the user from saving their FX settings.

File upload - Empty preview

In specific scenarios, the file preview was unavailable to view. This was determined to be a backwards compatibility issue with calculations created prior to February 2021.

What's Next?

The 4.6 release of AlphaVAT will focus on the essential platform upgrade to .NET Core 6.0 and essential bug fixes.
